## ACTIVE HARMONIC FILTER

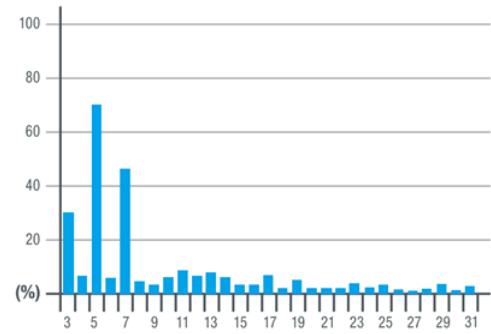

### Description

Active filters offer the best possible solution to solve quality-related problems in three-phase industrial, commercial or service installations and utilities caused not only by harmonics but also by the consumption of reactive power (usually of the capacitive type).

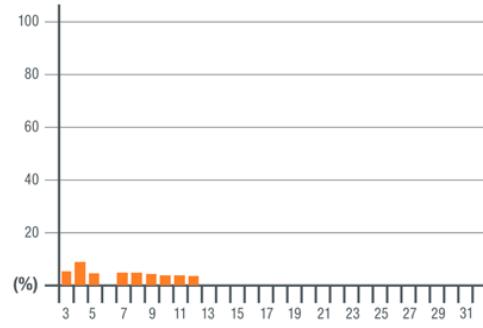

Active filters are equipped with an intuitive touch-screen display, allowing all the necessary programming actions to develop the following actions:

- Reduction of harmonics currents up to the 50th harmonic. Optional selection of the harmonic frequencies to be filtered in order to achieve the highest efficiency. The user can select the harmonic frequencies to be filtered.
- Power factor correction. Both inductive and capacitive powers.
- Current balance correction, improving the phase-to-phase consumption and reduction of neutral currents.

The correction rating of SINAF 3.0 is expressed as RMS current value. The available current can be used for any of the three actions described above.
